

TOPIC: MVC vs Web API

MVC usually returns web pages, styled and bright,
HTML views that users see on the site.

Web API returns data, simple and neat,
Usually JSON, no buttons or seat.

If users click links and browse with ease,
MVC is the best for pages they see.

If apps just need data to load and play,
Web API sends information in the fastest way.

On shows the look, the other the facts,
Pick up the right tool so nothing cracks.
